PAGE 1 · BUSINESS STRATEGY

# Dealflow

Tell Claude what you're charging. Dealflow gets you paid. Quotes that turn into invoices and chase payment, written by the customer's own Claude, with no AI inside our app.

## The problem

Freelancers and small agencies (designers, developers, marketers, consultants) lose time and money between "the client said yes on a call" and "the money is in the bank":

- **Writing quotes is slow.** Each one means rewriting scope, line items and terms in a Word or Canva template. Invoicing tools only give a blank form.
- **No signal after sending.** A PDF on WhatsApp or email gives no sign of whether the client opened it, agreed to it or forwarded it to finance.
- **Chasing payment is awkward, so it doesn't happen.** Reminders get sent late, inconsistently, or not at all, and cash flow suffers.

## Who it's for

**Beachhead:** Indian freelancers and 2–20 person studios and agencies who *already pay for Claude* and send 5–30 quotes a month. They are comfortable with AI, price-sensitive and connected through communities, so word of mouth spreads fast. **Next:** the same profile in South-East Asia, the US and the UK, priced in USD.

## The solution, and why people need it on top of Claude

**1 · CLAUDE WRITES**
"Quote Acme for a logo redesign, ₹40k, half upfront." Scope, items, terms.

**2 · DEALFLOW STORES**
Quote lands in the dashboard. Owner edits anything.

**3 · CLIENT ACTS**
Opens a public link and accepts in one click. It becomes an invoice.

**4 · UNTIL PAID**
Claude-written reminders go out on schedule and stop when paid.

**Claude alone** can write a great quote, but it can't host it, see that the client opened it, record an acceptance with a timestamp, keep numbering and status across months, or send an email next Tuesday after the chat has closed. **Invoicing software** can do those things but makes you fill forms. Dealflow combines both: the writing comes from the AI you already pay for, and Dealflow keeps the deal live until it's paid.

## Business model and pricing

| Plan | Price | For |
|---|---|---|
| Free | ₹0 | 3 active quotes, "Sent with Dealflow" footer (our growth loop) |
| Pro | ₹499 / month · $9 outside India | Unlimited quotes and invoices, reminders, own branding |
| Studio | ₹1,499 / month · $29 | Up to 5 seats, shared client list, custom domain for links |

**Cost to serve one paying customer: about ₹26 a month.** That is ₹8 for hosting and database, ₹4 for email (~40 a month), ₹14 in fees for collecting our own subscription, and **₹0 for AI**, because the customer's Claude plan does that work. With a blended ARPU of ₹699 (80% Pro, 20% Studio), **gross margin is about 96%**.

**Unit economics.** Assumptions: blended CAC of ₹1,500, mostly community-led, and 4% monthly churn. That gives an LTV of about ₹16.8k, **LTV:CAC of about 11×** and payback in about 2.2 months. **Later upside:** built-in payment links with a 0.5% fee on money collected through Dealflow. Detail is in *Dealflow_Economics.xlsx*.

## Growth

**First 100 customers (about 90 days):** (1) founder-led outreach to my own network of freelancers and agency owners, with a 30-day free Pro trial for setup help; (2) build-in-public demo clips on LinkedIn and X ("Claude wrote this quote, the client accepted it in 40 seconds"); (3) Indian design, developer and marketing communities (Discord/Slack groups, r/freelance_india, Behance/Dribbble circles); (4) listing in MCP and Claude connector directories; (5) the **viral loop**: every quote a client opens carries "Sent with Dealflow", and clients are often businesses that send quotes too.

| Milestone | Paying customers | MRR | ARR | What's true then |
|---|---|---|---|---|
| Month 3 | 100 | ₹0.7 L | ₹8.4 L | Retention proven with India freelancers |
| Year 1 | 1,000 | ₹7 L | ₹84 L | Payment links live; WhatsApp reminders; USD pricing |
| Year 3 | 12,000 | ₹84 L | ₹10 Cr | Accounts-receivable layer for small businesses in India + SEA; payments take-rate adds about 30% |

PAGE 2 · PRODUCT EXECUTION

# The working product

Live, free to try, and connected to Claude through MCP. No AI keys anywhere in the app.

| What | Link / detail |
|---|---|
| Live app | `https://dealflow-2vnc.onrender.com` |
| Test login | `demo@dealflow.app` / `demo1234` (or sign up for your own account in 20 seconds) |
| MCP connector (test account) | `https://dealflow-2vnc.onrender.com/mcp/demo-volopay-7Qx2pLk9` |
| Source code | `github.com/sauravanurag111/ClaudeBiz` |

## Connect it to Claude (about 1 minute)

1. In Claude (claude.ai or desktop): **Settings → Connectors → Add custom connector**.
2. Name it **Dealflow**, paste the MCP URL above, leave the OAuth fields empty, click **Add**.
3. In a new chat, enable Dealflow in the tools menu and ask for a quote. Allow the tool when Claude asks.

## The Claude integration: 9 MCP tools

| Tool | Claude uses it to… |
|---|---|
| `create_quote` | Send the quote it wrote (title, scope, line items, tax, discount, payment terms, T&Cs). Dealflow emails it to the client straight away and schedules follow-ups automatically. |
| `update_quote` | Apply changes ("add a 10% discount", "split the logo into 2 phases"). |
| `send_quote` | Email the client the link, with a message Claude writes. |
| `schedule_reminders` | Queue a reminder sequence it writes, from polite to firm, with placeholders like `{{amount}}` that Dealflow fills in. |
| `list_quotes`<br>`get_quote` | Answer "What's unpaid? Did Acme open it?" with live status, views, acceptance and activity. |
| `mark_paid`<br>`archive_quote`<br>`get_business_profile` | Close the loop (this cancels pending reminders) and read the sender details. |

## Demo flow (as in the video)

1. **In Claude:** "Create a Dealflow quote for Priya at Acme Corp (priya@acme.com): logo redesign, 3 concepts, 2 revision rounds, ₹40,000, plus brand guidelines ₹15,000, 18% GST, 50% upfront." Claude writes the scope and terms and calls `create_quote`.
2. **In Dealflow:** Q-0001 is on the dashboard. The owner edits a price and adds a line item; totals update live. Saving changes the client's page immediately.
3. **As the client:** open the public link (no login). The owner's dashboard shows "Opened". Click **Accept**: it becomes invoice INV-0001 with payment details. Click **I've paid** with a UTR and a payment screenshot. The dashboard shows "Client marked paid".
4. **Back in Claude:** "Schedule 3 reminders…", then "What's unpaid?", then "Mark it paid". Pending reminders are cancelled automatically.

## Editing experience

Every field Claude writes can be edited in the browser: client details, scope, line items (add, remove, live totals), discount, tax, currency, validity and due dates, payment terms and T&Cs. Reminders can be edited too (send time, subject, body), sent immediately, or deleted. An activity timeline records who did what: Claude, the owner or the client.

## What is real vs. simulated in v1

REAL MCP server and tools, Postgres storage, owner editing, public client pages, view tracking, acceptance records, quote-to-invoice conversion, reminder scheduler with automatic cancellation, live deployment.

SIMULATED **Payments**: no gateway yet. The invoice shows the owner's UPI or bank details, the client clicks "I've paid" and the owner confirms. **Email**: real when a Brevo key is configured; otherwise reminders are marked "recorded, email off" in the app. The demo account's payment details are samples.

NEXT Razorpay/Stripe payment links with auto-reconciliation, WhatsApp reminders, OAuth connector, GST-compliant invoice PDFs, team seats.
